1. Overview

Godrop is an on-demand delivery and logistics platform built to serve customers across Nigeria — not a single-city product. It launches first in Lagos to prove the model, with planned expansion to Abuja, Port Harcourt, and Ibadan as the platform scales nationwide. It connects customers, vendors (restaurants, grocery/retail/pharmacy stores), independent delivery riders, and — via a separate product line, **GoDrop Invest** — retail investors who fund the vehicles riders operate.

1.1 Problem statement

Nigerian urban consumers lack a single, reliable platform for everyday delivery needs (food, groceries, retail goods, pharmacy items, parcels) and larger logistics needs (moving trucks). Existing options are fragmented across category-specific apps, cash-heavy, and hard to track. Small vendors and riders have no integrated tools for order management, payouts, or growth. Separately, individuals who want to invest in the delivery/mobility economy (funding a Keke, a shuttle, or a dispatch bike) have no accessible, transparent way to do so.

1.2 Product goals

- Give Nigerian consumers nationwide one app to order food, groceries, retail goods, pharmacy items, book a parcel courier, or book a truck for relocation — starting in Lagos and expanding city by city.
- Give vendors full self-service tools to manage catalog, orders, payouts, and staff.
- Give riders a single app to receive jobs, manage deliveries, and track earnings, with low-friction phone+OTP onboarding.
- Give Godrop operations staff full visibility and control over the marketplace via an internal dashboard.
- Give investors a transparent way to fund revenue-generating delivery vehicles and track fixed-term returns.
- Handle money, phone numbers, and payments the way the Nigerian market expects: Naira/Kobo precision, Paystack, Termii SMS, cash-on-delivery support.

1.3 Non-goals (current scope)

- No inter-city delivery or long-haul logistics beyond truck-booking for relocation.
- No open self-serve vendor signup outside admin-approved onboarding — vendors are vetted (CAC registration + government ID) before going live.
- No multi-currency support — Nigerian Naira only at this stage.
- No public investor secondary market — investments are held to term, not tradable.

2. Users & Personas

Persona	App	Core need
Customer	Customer (Flutter)	Order food/groceries/retail/pharmacy items, book parcels or trucks, track delivery live, pay by card/wallet/cash
Rider	Rider (Flutter)	Receive and accept job offers, navigate pickup→dropoff, update status, get paid out reliably
Vendor staff (STAFF/MANAGER/OWNER)	Vendor (Flutter)	Manage incoming orders, catalog, store hours, staff, and withdraw earnings
Investor	Investor / GoDrop Invest (Flutter)	Fund a vehicle asset for a fixed term, track payouts, manage wallets
Ops / admin staff	Dashboard (Next.js, ops.godrop.ng)	Monitor the whole marketplace, approve vendors/riders, resolve disputes, message users, run analytics
Prospective customer/vendor/rider	Landing (Next.js, public site)	Learn about Godrop, download the app, apply as a vendor/rider

2.1 Roles & permissions — vendor app

Vendor admins have three roles, enforced both client-side (UI gating) and server-side:

- **STAFF** — catalog + order actions (accept / preparing / ready / reject)
- **MANAGER** — STAFF + analytics, cancel any pre-pickup order, view settings/team/audit logs
- **OWNER** — MANAGER + update store settings, manage team, withdraw from wallet

2.2 Admin roles — dashboard

Admins (`Admin` model) have `AdminRole` / `AdminType` distinctions for system-wide vs. business-scoped access (`systemAdmin` vs `businessAdmin` routes), controlling which vendors/riders/orders they can see and act on.

3. Core Services / Order Types

Godrop supports six order categories, unified under one `Order` model (`OrderType` enum: `FOOD` , `GROCERY` , `RETAIL` , `PHARMACY` , `PARCEL` , `TRUCK`):

1. **Food delivery** — restaurant catalog, menu browsing, cart, checkout, delivery tracking, reviews.
2. **Grocery delivery** — grocery store catalog and checkout, same order lifecycle as food.
3. **Retail delivery** — general retail stores/products, with category browsing.
4. **Pharmacy delivery** — pharmacy stores and products (a `VendorType.PHARMACY` subset of retail-style vendors).
5. **Parcel delivery** — point-to-point courier orders; supports multiple dropoffs, vehicle-type selection (priced per-km + base fee), instant quotes.
6. **Truck booking** — relocation bookings; apartment-type-based pricing, per-km and per-loader pricing components, quote-before-book flow.

All six share a common checkout → payment → assignment → tracking → delivery lifecycle, a common `Order` status machine (see §5.3), and a shared tracking code customers use to follow delivery.

4. Functional Requirements by App

4.1 Customer app

- **Auth:** phone + OTP registration/login (Termii SMS), JWT access+refresh tokens.
- **Home:** category selector across food/grocery/retail/pharmacy/parcel/truck.
- **Browse & search:** per-category store/restaurant listings, product search, filters.
- **Cart & checkout:** multi-item cart, saved-address delivery selection, payment choice (card via Paystack, wallet, cash-on-delivery where enabled), promo codes.
- **Order tracking:** live status, rider location on map via WebSocket, ETA in minutes.
- **Order history:** reorder, rate/review, cancel pending orders.
- **Wallet:** top-up via Paystack, transaction history, pay from balance.
- **Profile:** saved addresses, saved cards, avatar, favorites, push preferences, notification inbox.
- **Parcel flow:** pickup/multi-dropoff addresses, vehicle-type quote, book.
- **Truck flow:** apartment-type selection, loader count, distance quote, book.

4.2 Rider app

- **Auth:** phone + OTP, refresh-token rotation.
- **Onboarding:** KYC document submission, bank account for payout, availability toggle.
- **Job intake:** receive job offers via FCM push, accept/reject within a window.
- **Active delivery:** sequential status updates — picked-up → in-transit → delivered (or per-dropoff delivered/failed for multi-drop parcels) — live location streaming.

- **Earnings:** per-delivery breakdown, running summary, withdrawal requests, withdrawal history.
- **Notifications:** job alerts, payout confirmations, admin messages.
- **Profile:** vehicle info, documents, avatar, availability status.

4.3 Vendor app

- **Auth:** email + password login (not phone/OTP), single 7-day JWT with **no refresh token**, forgot-password via emailed reset link.
- **Onboarding:** unauthenticated multi-part application (business info, geolocation, owner account, CAC registration + government ID, optional utility bill) — vendor created as **PENDING**, requires system-admin approval before public listing.
- **Dashboard:** revenue analytics summary/graph, store open/closed toggle.
- **Orders:** incoming queue with status filters, detail view, role-gated status transitions; rejecting/cancelling a paid order auto-refunds the customer's wallet.
- **Catalog:** product + category CRUD, image upload, availability toggle, stock tracking.
- **Wallet:** balance (Naira decimals — see §5.1 exception), transaction history, bank account linking, withdrawal requests.
- **Team:** invite/change-role/remove staff (OWNER only).
- **Settings:** store profile, opening-hours editor (per-weekday, Africa/Lagos time, overnight ranges) — view for MANAGER+, edit for OWNER.
- **Profile:** edit profile, change password, notification inbox, audit log view.

4.4 GoDrop Invest — Investor app

- **Auth:** email/phone + password registration with OTP verification; access+refresh token pair; login by email or phone.
- **Assets:** browse investable vehicle assets by class (Keke tricycle, city shuttle, ride-hail car, dispatch bike), each with a projected ROI (basis points) and status.
- **Plans:** fixed-term investment plans — Starter (6 mo), Rider (12 mo), Fleet (18 mo) — each with a lock period and monthly rate.
- **Invest flow:** multi-step (preview → fund/confirm → verify via Paystack) investment against a chosen asset + plan; generates a monthly payout schedule; capital returns at maturity.
- **Portfolio:** view active/matured investments, payout history.
- **Wallets:** Main (source of investable funds), Payout (destination of monthly returns), Flow Safe (interest-bearing vaults, flexible or locked) — all in integer Kobo.
- **KYC:** BVN, government ID, address verification steps, gating investment ability.
- **Bank accounts:** add/remove/set-primary payout bank account.
- **Notifications & settings:** payout alerts, KYC status updates, support FAQs.

4.5 Ops dashboard

Internal tool for Godrop staff, gated by admin login (NextAuth):

- **Overview** — daily stats, active orders, online riders.
- **Orders** — full order table (filter/sort/paginate), detail view with timeline/map, cancel/status override.
- **Vendors / Businesses** — list, detail, approve/reject/suspend/reinstate, document review, wallet view, withdrawal approval.
- **Riders** — list, detail, KYC approval, toggle active, assign order manually, view earnings/withdrawals, live location.
- **Customers** — list, detail, order history, wallet view/transactions, status (ban/unban).
- **Trucks / Parcels** — booking management, vehicle-type and apartment-type + pricing config.
- **Analytics** — GMV, orders/day, delivery time, category split.
- **Disputes** — flagged orders, resolution workflow.
- **Messaging** — bulk/targeted email (customers/riders/vendors) and SMS sender-ID management.
- **Push** — targeted or broadcast push notifications.
- **Admins / Team** — manage internal admin accounts and roles.
- **Heroes / Promotions / Banners** — marketing content shown in the customer app.
- **Settings** — platform-wide config (rider earning rate, coverage zones, pricing).
- **Audit logs** — export and review of sensitive admin/vendor actions.

4.6 Landing site

Public marketing site: home, about, contact, vendors/riders/business recruitment pages, privacy policy, terms of service, community guidelines, password-reset landing (deep-links from email), APK downloads.

5. Key Business Rules

5.1 Money

All monetary values are stored and transmitted as **integer Kobo** ($\text{₦} \times 100$) across almost every endpoint, to avoid floating-point currency bugs — the sole exception is the **vendor wallet** endpoints, which use Naira decimals (a deliberate, documented inconsistency vendor-app developers must handle explicitly). Investor rates (ROI, monthly return) are expressed in **basis points** (e.g. `projectedRoiBps: 3200` = 32%). Naira is always the display currency; Kobo is always the storage/wire currency.

5.2 Phone numbers

All phone numbers are normalized to **E.164** (`+234XXXXXXXXXX`). Apps accept local `0803...` input and normalize before sending to the API.

5.3 Order lifecycle

- Vendors move orders PENDING→ACCEPTED (or →CANCELLED to reject) and ACCEPTED→PREPARING→READY_FOR_PICKUP.
- Riders move orders READY_FOR_PICKUP→PICKED_UP→IN_TRANSIT→DELIVERED (or →FAILED), with per-dropoff granularity for multi-drop parcel orders.
- A MANAGER-or-above vendor role can cancel any order prior to pickup.
- Cancelling or rejecting an order that was already paid automatically refunds the customer's wallet.

5.4 Payments

- `PaymentMethod` : CARD (Paystack), WALLET , CASH (opt-in per vendor via `cashOnDeliveryEnabled`), WALLET_CARD (hybrid).
- `PaymentStatus` : PENDING → PAID , or PAID → REFUNDED , or → FAILED .
- Paystack is used for all card payments, wallet top-ups, and investor wallet funding (initialize + verify pattern).

5.5 Vendor status

PENDING → APPROVED (publicly listed) or PENDING → REJECTED ; an approved vendor can later be SUSPENDED and reinstate d by admin.

5.6 Nigerian market considerations

- Goal is nationwide Nigeria coverage. Launch market: Lagos, used to prove the model. Rollout order: Abuja → Port Harcourt → Ibadan → Kano.
- Cash-on-delivery must remain a first-class payment option — not all customers have cards.
- Delivery ETAs are always shown as a duration ("~25 min"), never a clock time, due to Lagos traffic unpredictability.
- Address entry should surface well-known Lagos areas (Ikeja, VI, Lekki, Yaba, Surulere) to reduce typing.
- Low-bandwidth UX: lazy-loaded images, paginated lists across all mobile apps.

6. Success Metrics

Indicative — to be finalized with business stakeholders.

- **Marketplace liquidity**: orders/day, GMV, active vendors, online riders per zone.
- **Delivery performance**: median time PENDING→DELIVERED per order type, rider acceptance rate, failed-delivery rate.

- **Retention:** repeat order rate (customers), repeat job acceptance rate (riders).
- **Vendor health:** vendor approval turnaround time, payout cycle time, dispute rate per 1,000 orders.
- **Investor product:** total assets funded, investor retention through maturity, payout on-time rate.
